ENTERPRISE SALES OVERVIEW

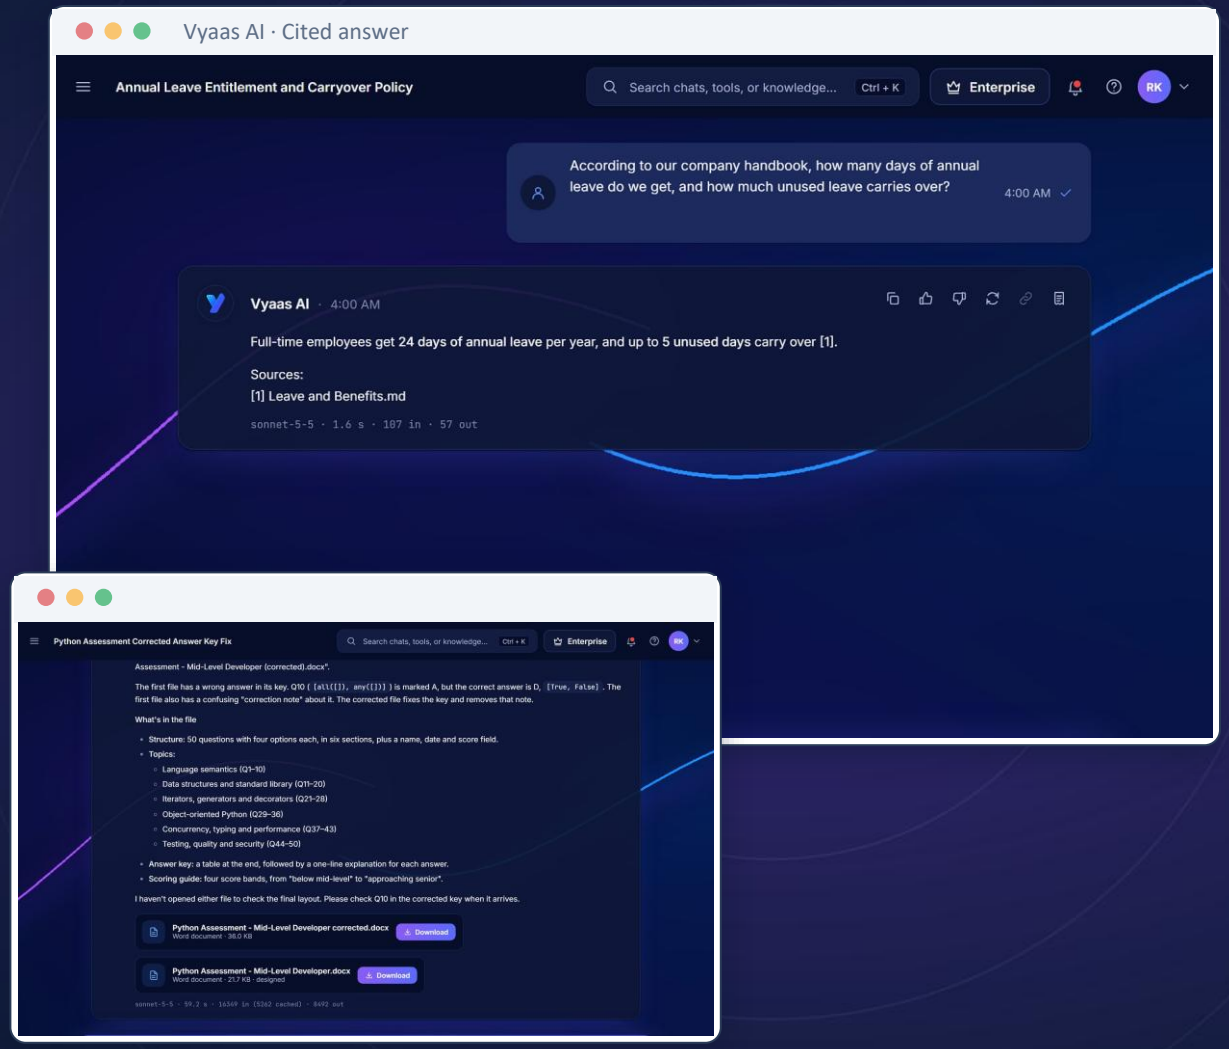

Vyaas AI

ENTERPRISE AI ASSISTANT

Answers you can cite. Code you can ship.

One governed workspace where teams chat over their own knowledge, generate finished documents and hand engineering tasks to a sandboxed coding agent.

Cited answers | Coding agent | Org governance

THE PROBLEM

AI pilots stall when they can't be trusted, governed or shipped

Answers you can't trust

Generic chatbots answer without sources, so teams re-verify every reply by hand.

Your data, somewhere else

Company knowledge pasted into consumer tools: no policy, no isolation, no audit trail.

Suggests, doesn't ship

Copilots autocomplete lines but can't take a task through to a reviewed pull request.

Runaway token spend

Bloated prompts and repeated context make model bills unpredictable at scale.

Tool sprawl

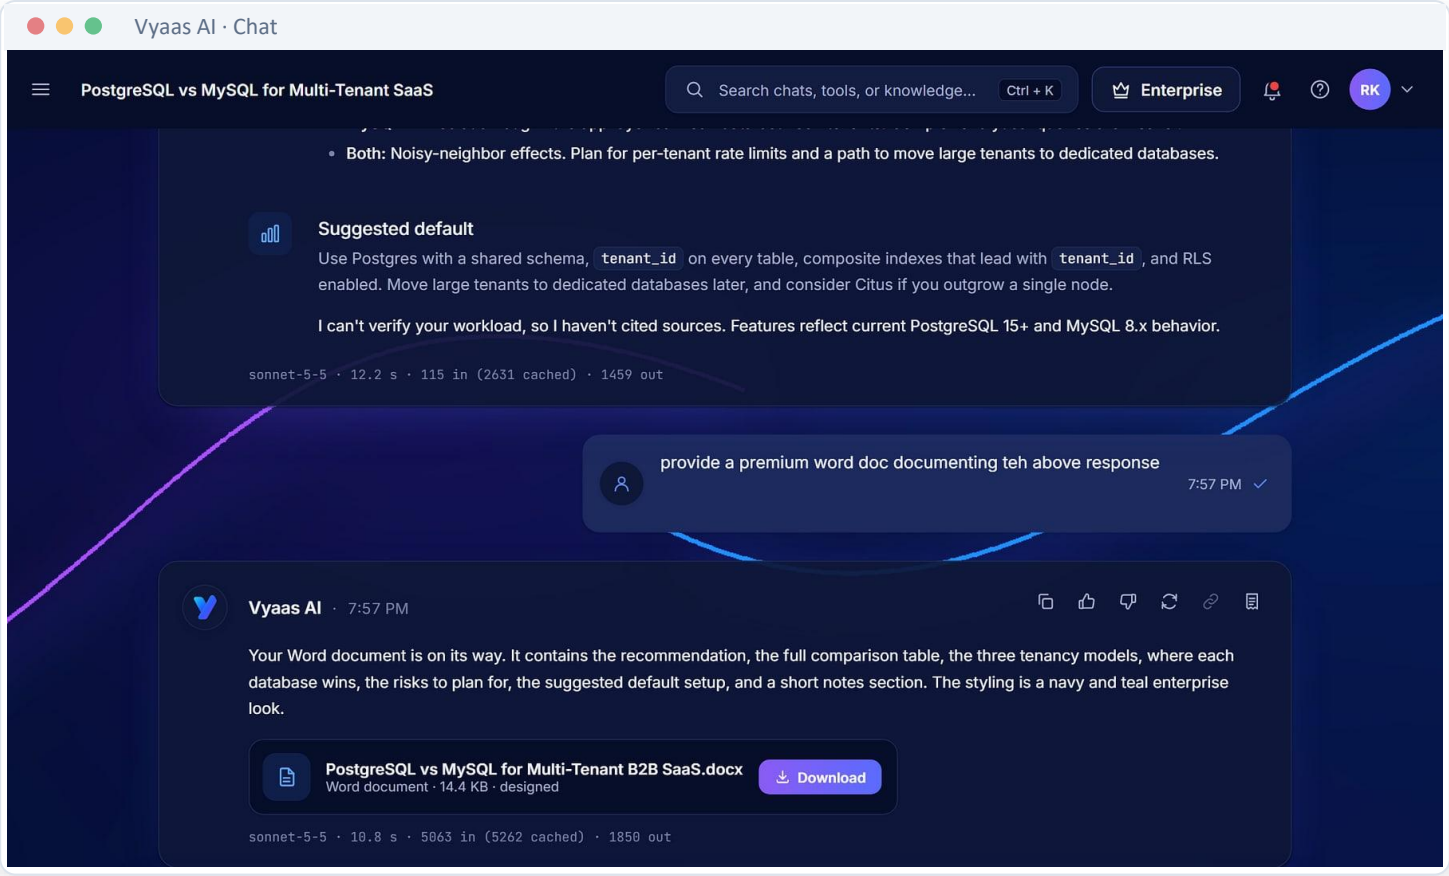

One tool to chat, another for documents, another for code: nothing shared or governed.

Expertise stays personal

Good prompts and assistants live with individuals and never reach the team.

MEET VYAAS AI

One platform to converse, build and govern

A structured comparison answer with a downloadable document (demo data).

Converse & create

Cited chat over your knowledge; documents and images on demand.

Build & ship

A coding agent that edits, tests and opens pull requests in a sandbox.

Govern & scale

Organisations, policies, audit, plans and automatic cost control.

Multi-model

Claude and OpenAI models behind one provider-agnostic catalogue.

AT A GLANCE

A real platform, counted from the code

14
functional modules

38
data models

102
routes and screens

368
automated tests

2
model providers: Claude and OpenAI

7
plan tiers, Guest to Enterprise

3
organisation roles

23k+
lines of Python

Source: static analysis of the Vyaas AI repository (10 Nov 2026): apps, models, URL routes, test functions and plan seed (apps/catalogue/seed.py).

WHO IT'S FOR

One platform, every seat in the room

The buyer

CTO, Head of Engineering or IT Director

Governs model choice, spend and data policy across the organisation.

Engineers

Members

Hand tasks to the coding agent; review and merge its pull requests.

Knowledge workers

Members

Cited answers, analyses, documents and assistants over company knowledge.

Org admins

Owner and Admin roles

Members, invitations, policies, shared assets and the audit log.

Organisation features (members, roles, policies, shared assets, audit) come with the Team and Enterprise plans; individuals start on Free, Plus, Pro or Max.

PRODUCT MAP

Fourteen modules, three pillars

Converse & Create

- Chat
- Knowledge Base
- Documents
- Assistants
- Tools

Build & Ship

- Coding Agent
- Git import, commit and PR
- Sandbox and approvals
- Connect companion

Govern & Scale

- Organizations
- Policies and audit
- Token Optimisation Engine
- Model Catalogue
- Billing and plans
- Analytics
- Admin console
- Notifications

Plus the platform underneath: email sign-in with a guest trial, search, and a provider-agnostic model catalogue shared by every module.

WHY VYAAS WINS

Eight differentiators the product actually proves

Answers you can cite

Grounded replies carry numbered sources from your own documents.

Code you can ship

The agent commits, pushes and opens pull requests on your repositories.

Token Optimisation Engine

Trims context before every request; savings reported per message.

Multi-model, no lock-in

Claude and OpenAI, chosen per conversation or task.

Org governance

Policies, roles, shared assets and an audit log per organisation.

Docs and images

Real Word, PowerPoint and Excel files and designed images.

Hardened sandbox

gVisor isolation, no network by default, three approval modes.

Clean, cite-first UX

Clarifying-question cards and visible reasoning.

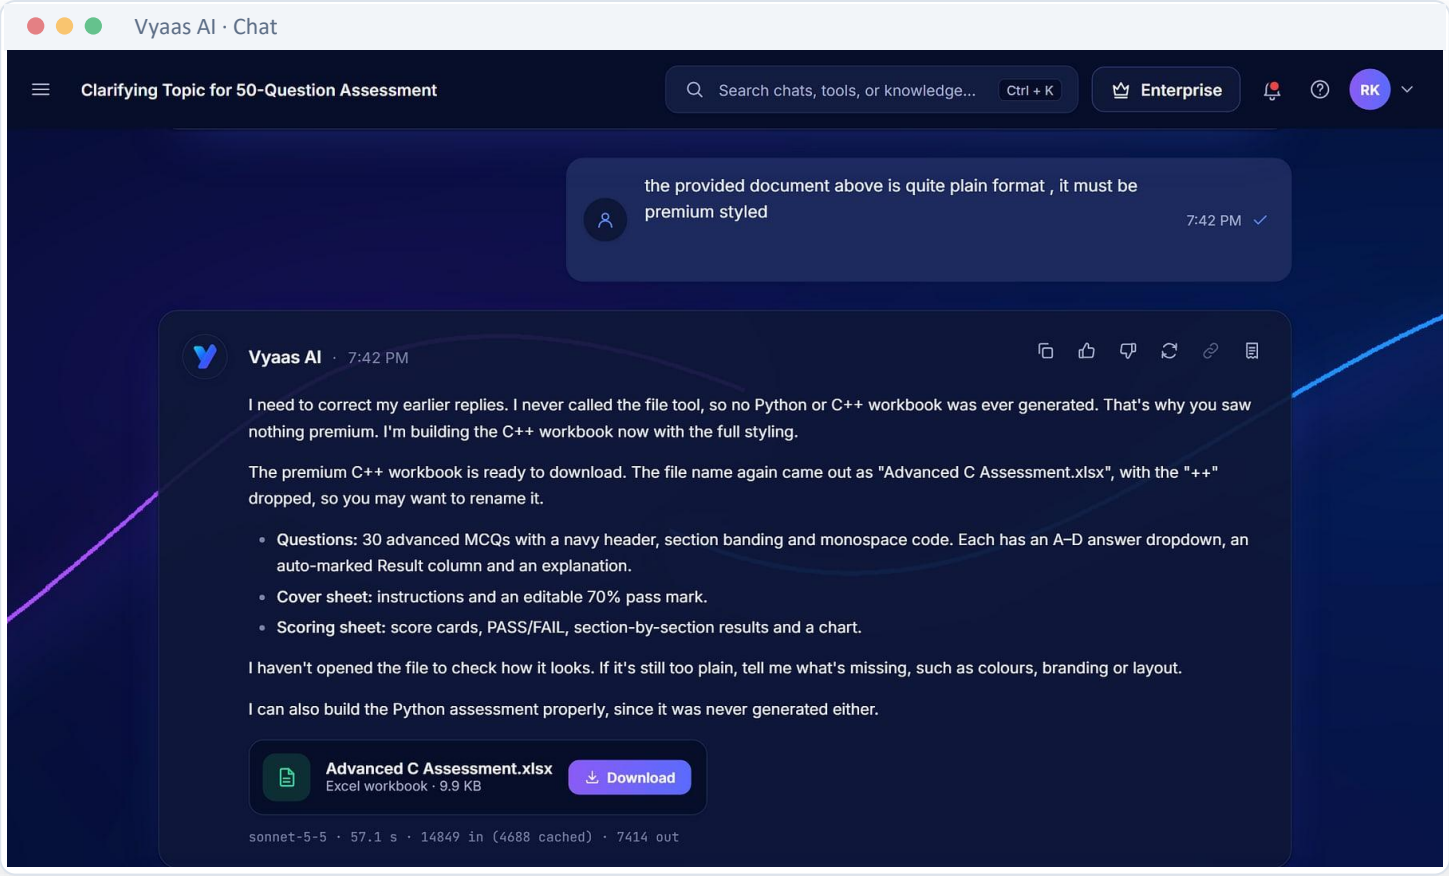

PILLAR 1 · CONVERSE & CREATE

Cited answers and finished work

Chat, Knowledge Base, Documents, Assistants and Tools, grounded in your own content.

CHAT

Lead with the answer: grounded, structured, finished

Chat: a follow-up answered with a regenerated Excel workbook to download (demo data).

Any model, one composer

Switch between Claude and OpenAI models per conversation.

Clarifying questions

When a request is ambiguous, Vyaas asks with option cards first.

Attachments

Office files, PDFs, code, data and images sent to the model.

Controllable reasoning

Effort from quick to extra-deep; web tools toggled per chat.

ANSWERS YOU CAN CITE

How every grounded answer carries its sources

1

Upload

PDF, Word, Markdown, CSV, JSON or HTML into a collection.

2

Ingest

Documents are split into chunks and indexed.

3

Retrieve

BM25 ranks the chunks that match each question.

4

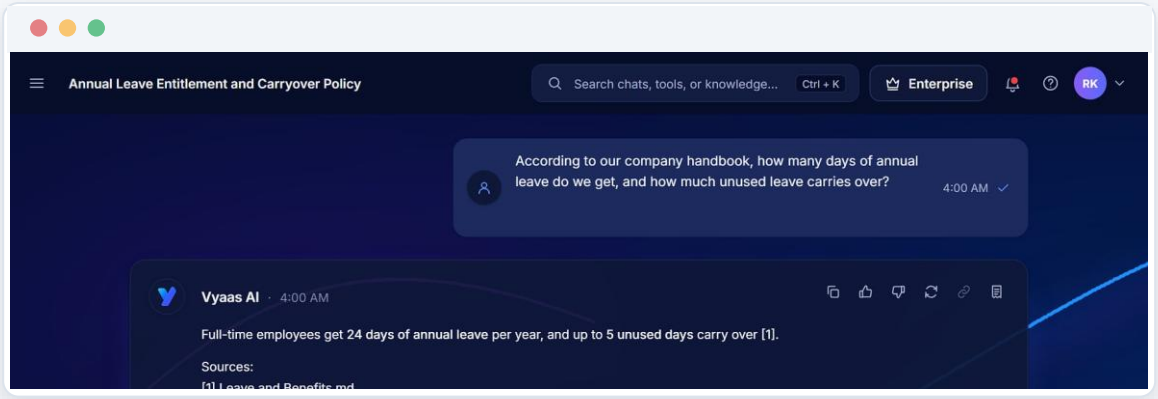

Cite

Top chunks go to the model as numbered sources.

5

Verify

The reply links each claim to its source.

Grounded answer citing [1] Leave and Benefits.md (demo data).

Deterministic retrieval

Lexical BM25 in pure Python: no vector store to run, same question gives the same sources.

Scoped knowledge

Collections are private or shared with the organisation, under policy.

KNOWLEDGE BASE

Grounded answers from your own content

Collections

Group documents by team, product or policy.

Many formats

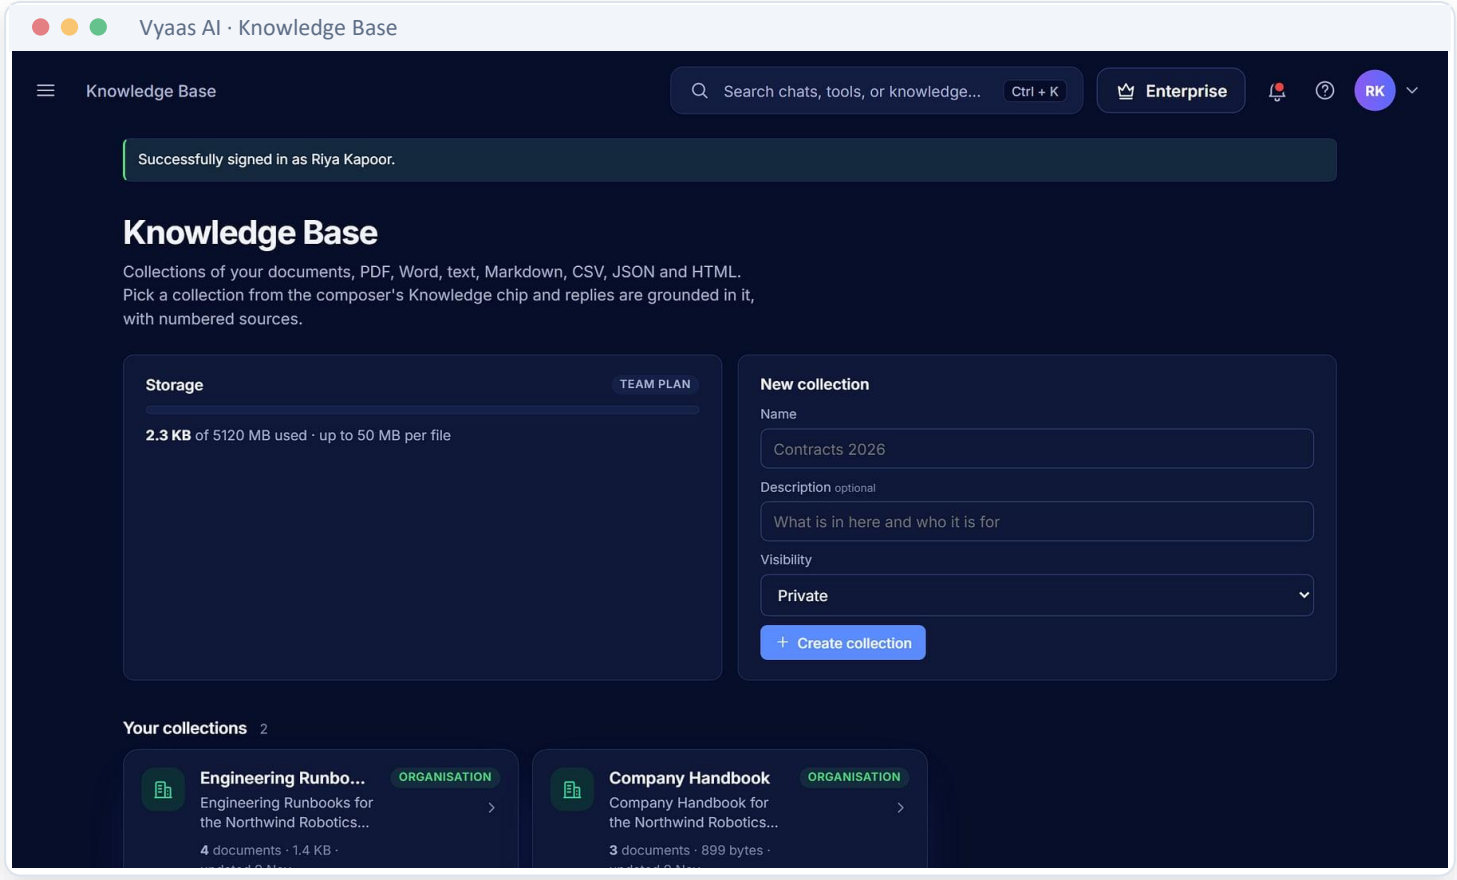

PDF, DOCX, TXT, MD, CSV, JSON and HTML.

Org or private

Share with the organisation or keep it to yourself.

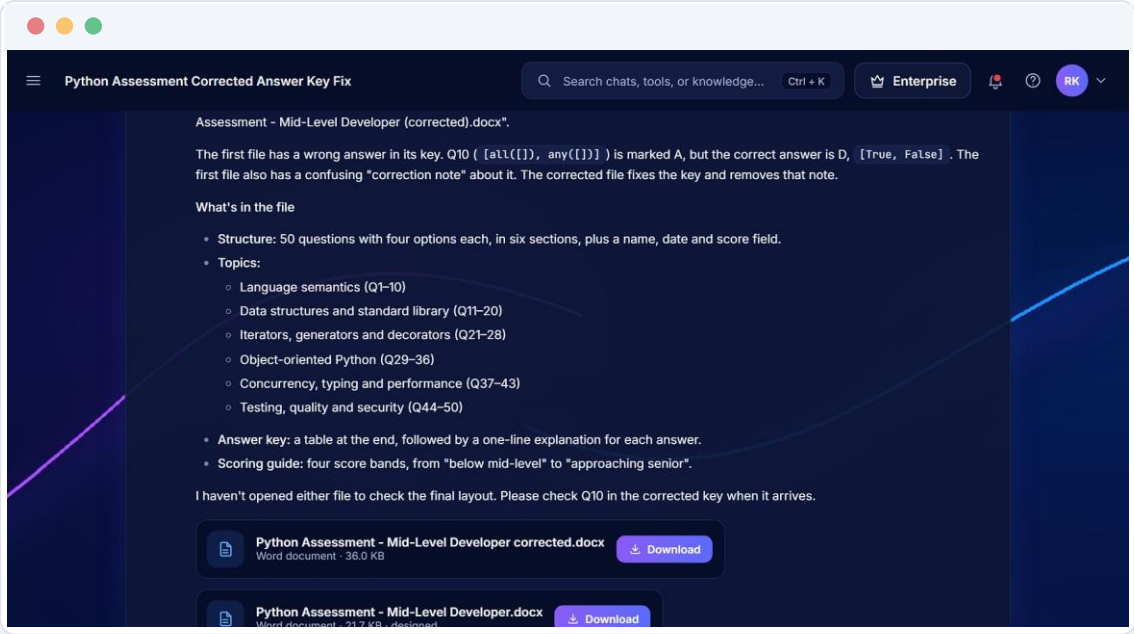

Chat with it

Open a chat grounded in a collection in one click.

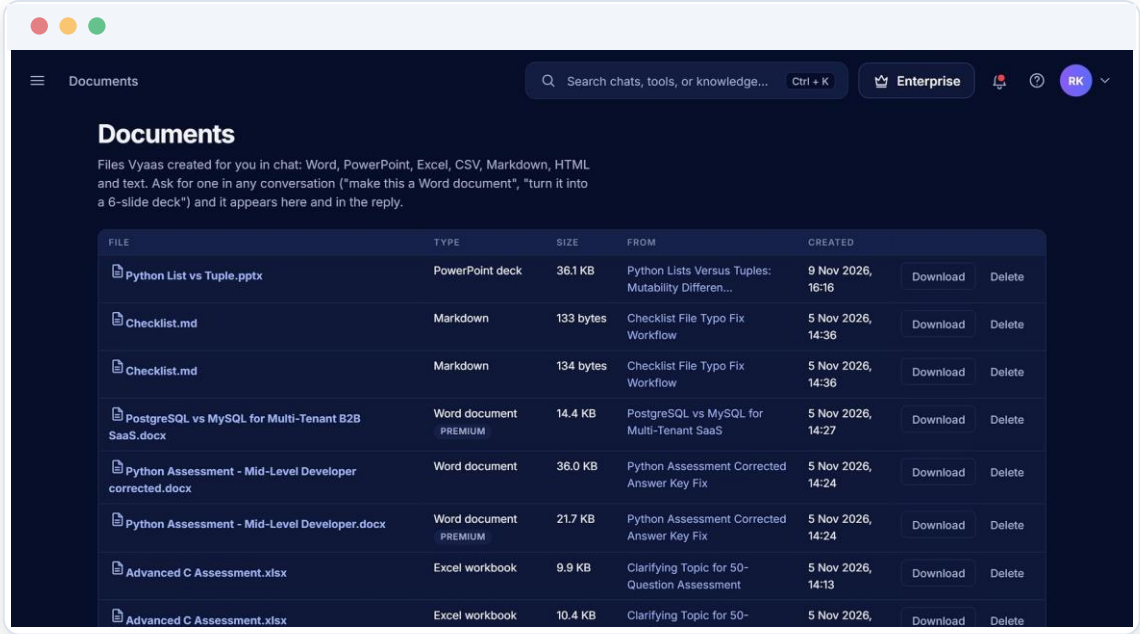

Knowledge Base: storage, collections and organisation-shared content (demo data).

Deliverables, not walls of text

A Word document generated in chat, with a download card (demo data).

Documents library: every generated file, by type and date.

Word · PowerPoint · Excel

Real files, plus CSV, Markdown, HTML.

Images

Designed graphics and photo-style images.

Download cards

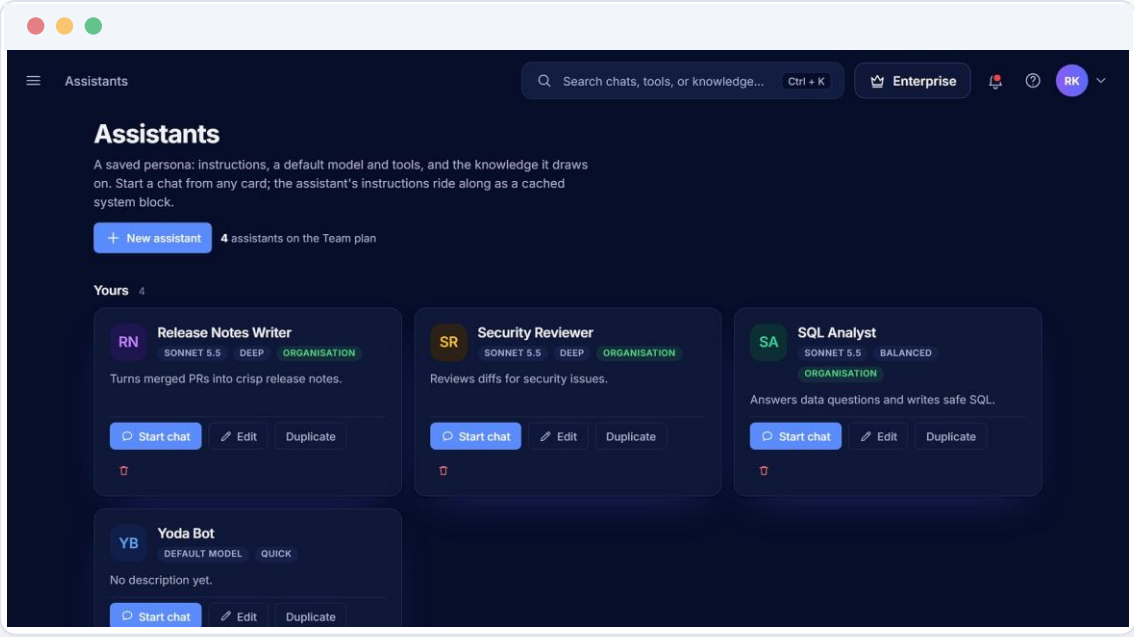

Update themselves as files finish.

Your library

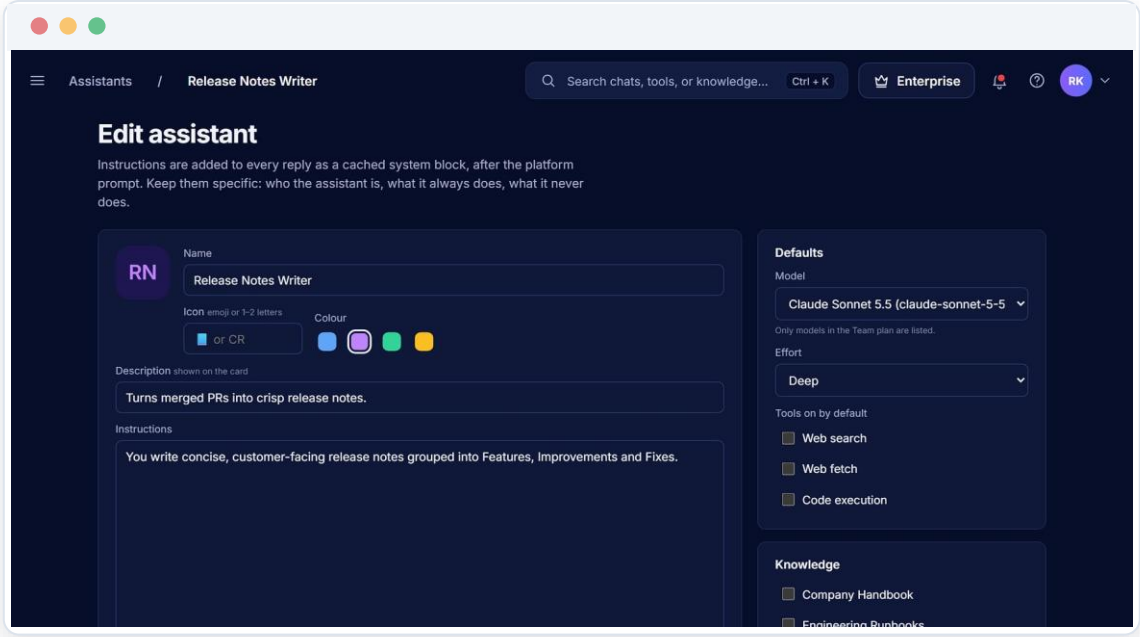

Owner-only, always downloadable.

ASSISTANTS

Repeatable expertise, shared with the team

Assistants gallery: your own, shared and starter templates (demo data).

Build an assistant: instructions, model, tools and knowledge.

Custom assistants

Own model, effort, tools and instructions.

Grounded in knowledge

Attach collections to an assistant.

Starter templates

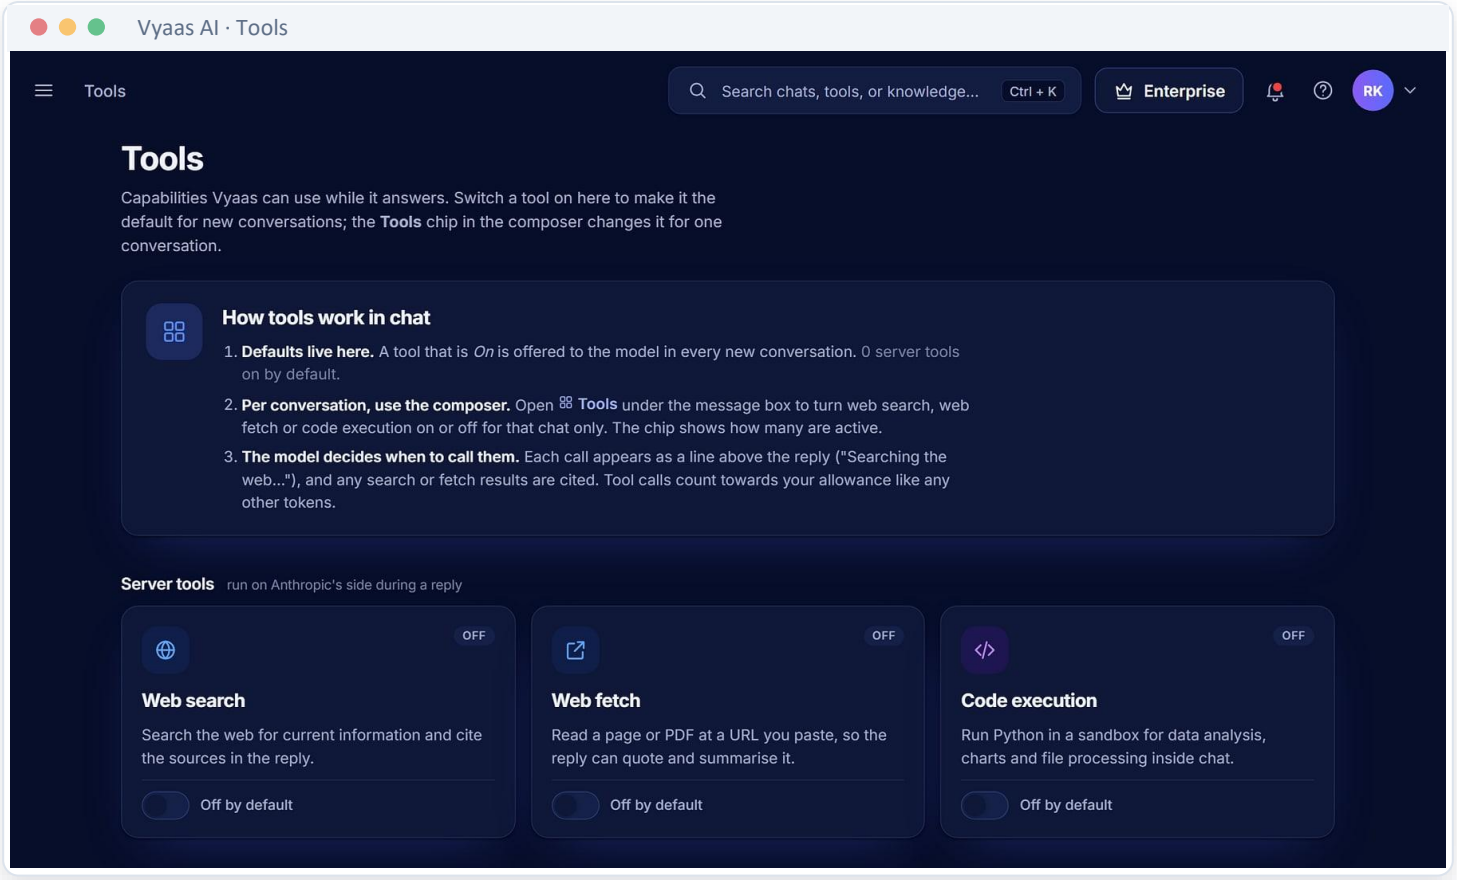

Spin up proven assistants fast.

Duplicate and share

One approved way of working.

TOOLS

Live data and compute, under policy

Tools catalogue: web search, web fetch, code execution and capabilities (demo data).

Web search and fetch

Current information with sources, or a page or PDF read on request.

Code execution

Run code for data analysis, in a sandbox.

Per-user and plan gated

Admins and plans decide what is available.

Preferences

Turn tools on where they help.

PILLAR 2 · BUILD & SHIP

From a task to a pull request

A resumable coding agent in a hardened sandbox: it imports your repository, edits, tests and opens a pull request.

CODING AGENT WORKFLOW

An engineer, not an autocomplete

1

Import

Clone a GitHub repository into a workspace, or upload a folder.

2

Task

Describe the change; attach a screenshot if it helps.

3

Edit in sandbox

The agent reads, edits and runs commands in isolation.

4

Test

Runs the suite and fixes what fails.

5

Approve

Your run mode decides what needs a yes; destructive commands always ask.

6

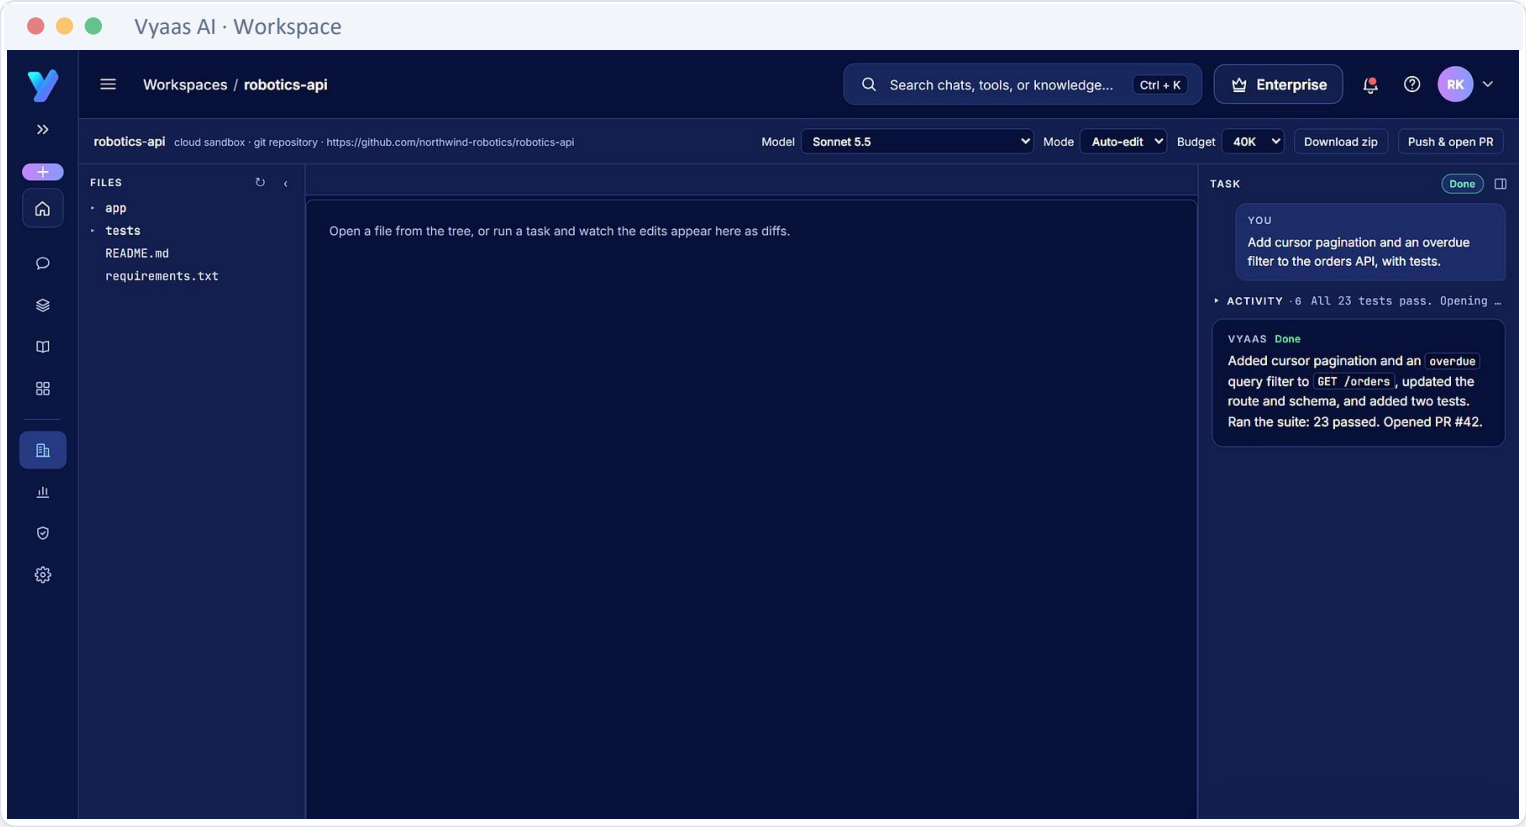

Ship

Commit, push and open a pull request for review.

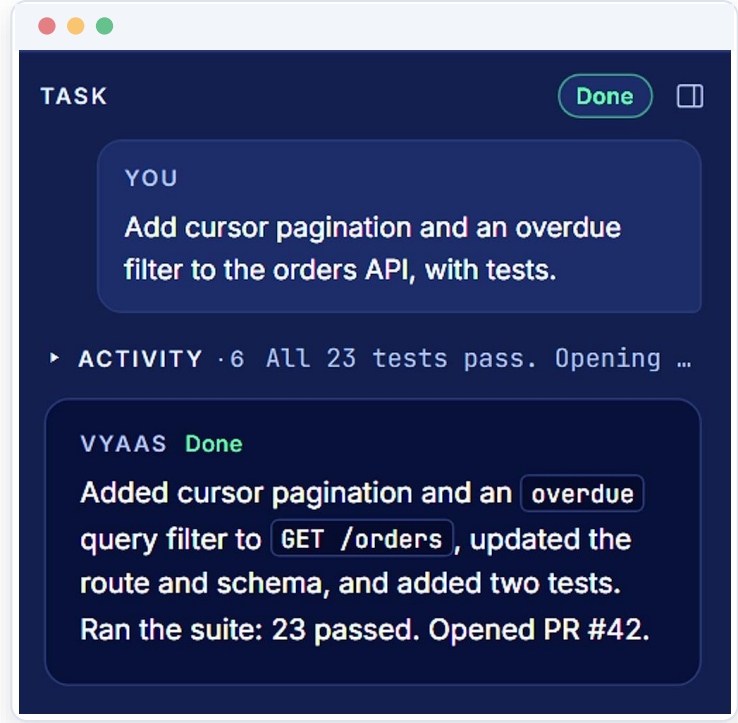

Resumable and crash-safe: long tasks survive restarts, and you can change the run mode mid-task. Every pull request goes through your normal review.

AGENT WORKSPACE

Files, diff, terminal and task on one screen

Workspace for a demo repository: file tree, diff area, terminal and the task rail (demo data).

Task rail, enlarged (demo data).

“Ran the suite: 23 passed. Opened PR #42.” Each task runs within a token budget set by plan.

SAFE AUTONOMY

Powerful, and contained in layers

Approval gate

Three run modes: Ask, Auto-edit, Full auto. Destructive commands always ask.

Egress control

No network by default; dependency installs only through a registry-only proxy.

gVisor sandbox

One hardened container per command: runsc runtime, read-only root, dropped capabilities, non-root, resource limits.

Encrypted credentials

Git tokens and provider keys encrypted at rest (Fernet) and never sent to the model.

THREE RUN MODES

Ask

Every command and every write asks first.

Auto-edit

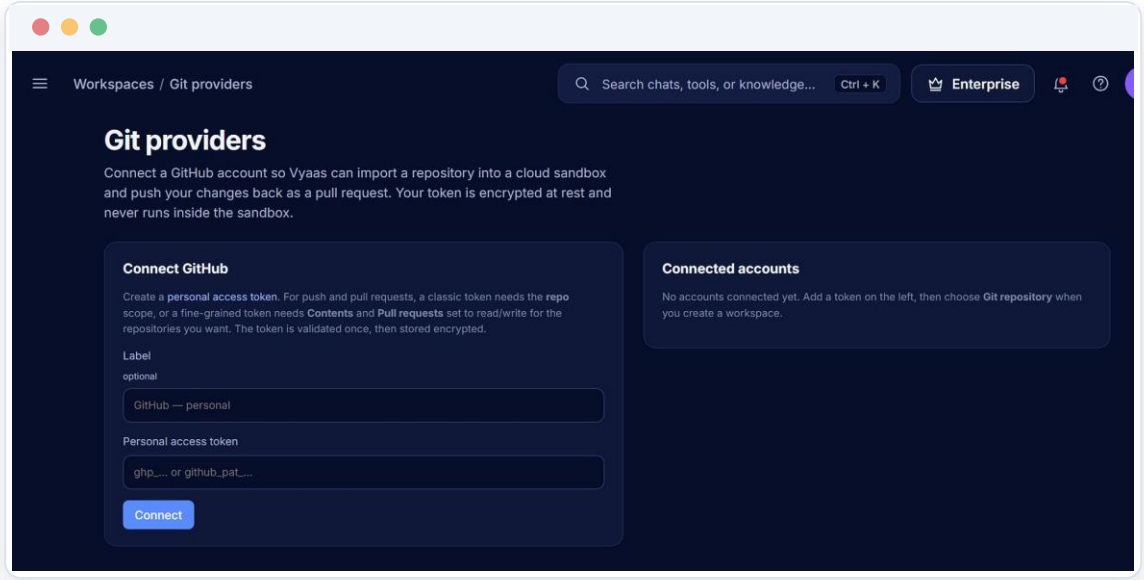

Edits run; every command asks.

Full auto

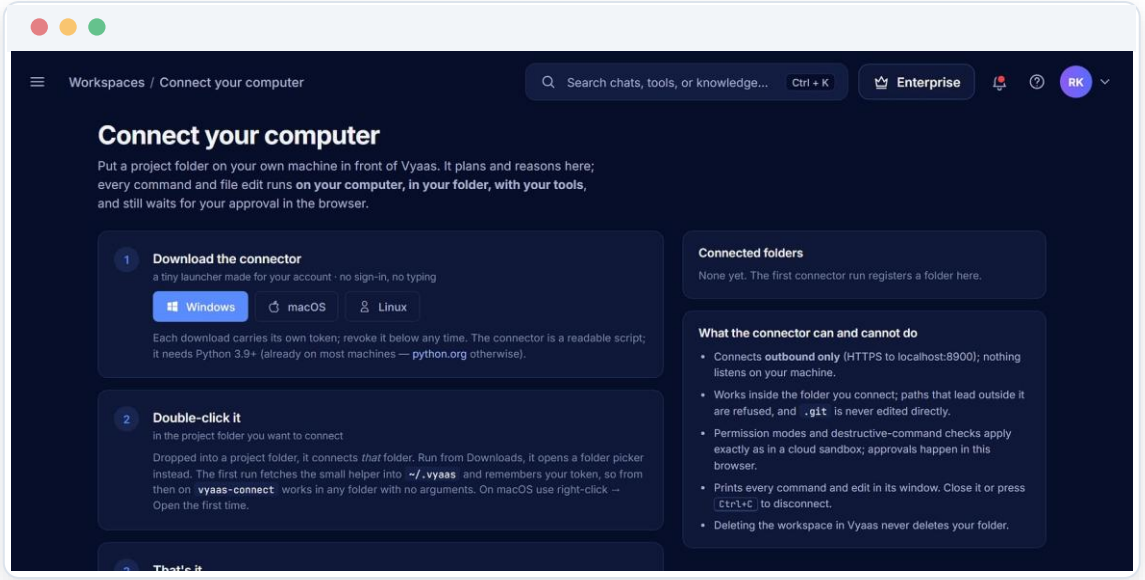

Everything runs except destructive commands, which always ask.

Autonomy is a dial, not a leap of faith: teams start in Ask mode and move to Full auto as trust grows, while data-loss and history-rewriting commands always stop for a human.

Connect your repositories, or run on your own machine

Git providers: connect GitHub with a personal access token, encrypted at rest.

Connect: a companion that runs the agent on your own computer.

GitHub today

Personal access token; GitLab planned.

Token encrypted

Never logged, never shown to the model.

Connect companion

Work in your local folders.

You stay in control

Clear limits on what Connect can do.

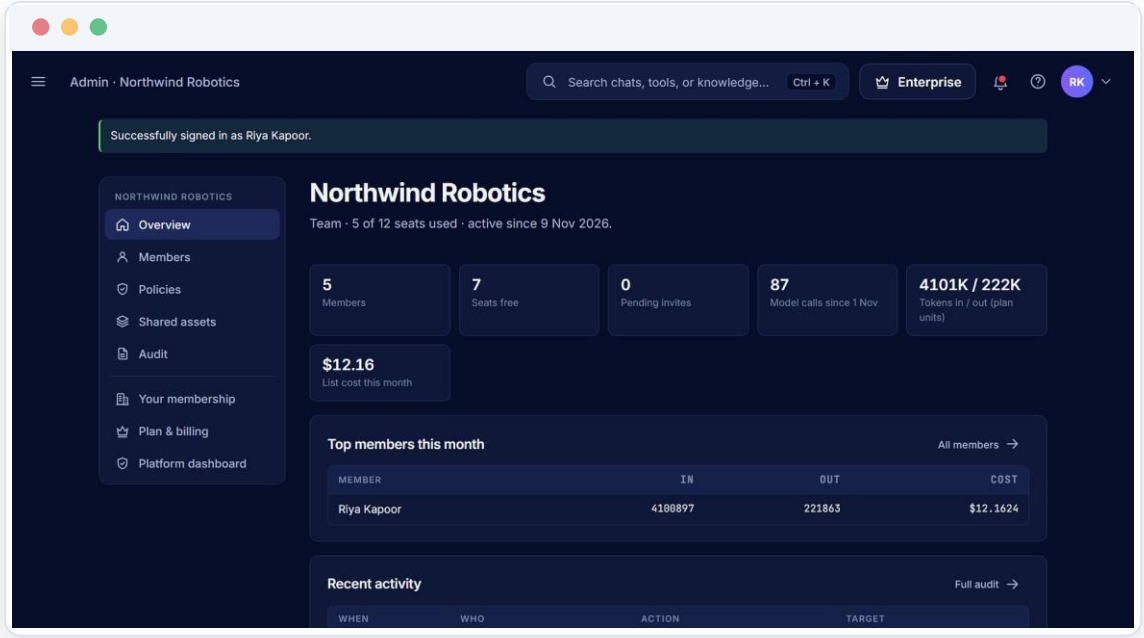

PILLAR 3 · GOVERN & SCALE

Control that scales with you

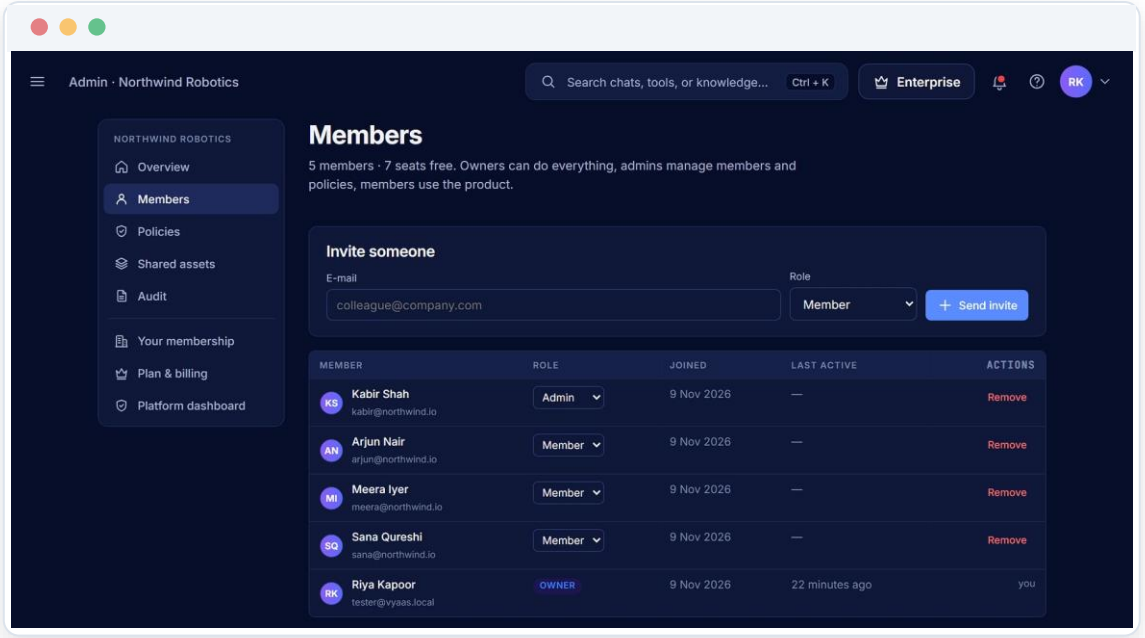

Organisations, policies, audit, plans, analytics and automatic cost control.

ORGANIZATIONS AND MEMBERS

One organisation, clear roles, managed seats

Organisation overview: members, seats, usage and recent activity (demo data).

Members: invite by email, assign Owner, Admin or Member.

Three roles

Owner, Admin, Member.

Invitations

Stored as token hashes only.

Seats and usage

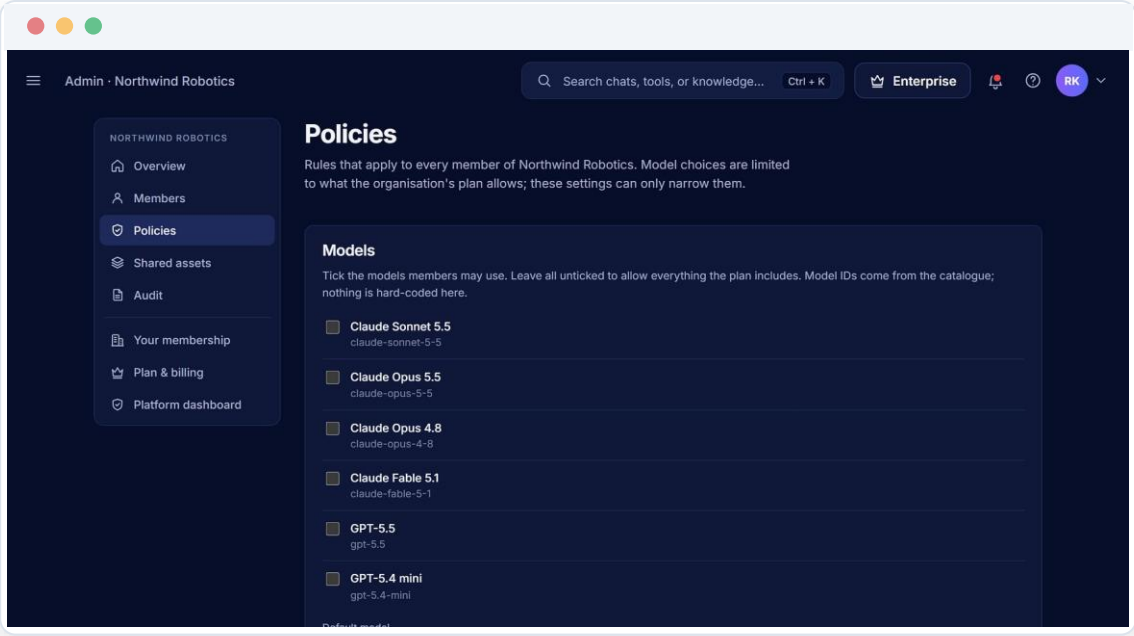

See who uses what.

One org per user

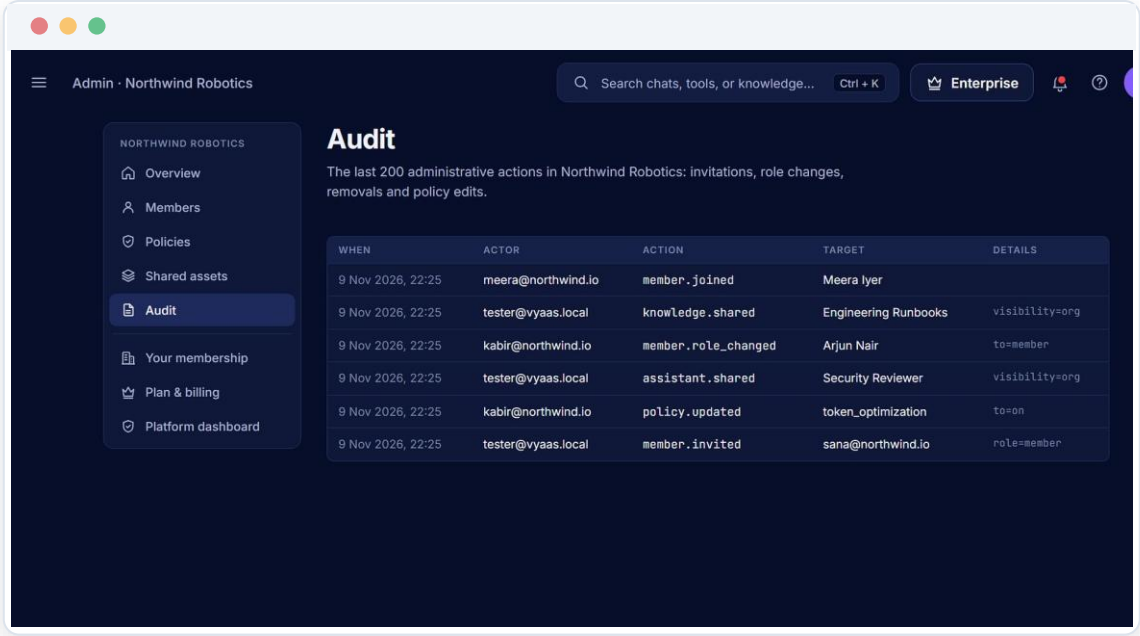

A clean tenant boundary.

POLICIES AND AUDIT

Narrow what members can do, and see everything admins did

Policies: allowed models, default model, web tools and sharing.

Audit log: every administrative action, with actor and time (demo data).

Allowed models

Only within what the plan allows.

Web tools on or off

For every member at once.

Optimisation policy

Force cost control org-wide.

Audit log

Invites, role and policy changes.

SHARED ASSETS

Share expertise, not just access

Shared assistants

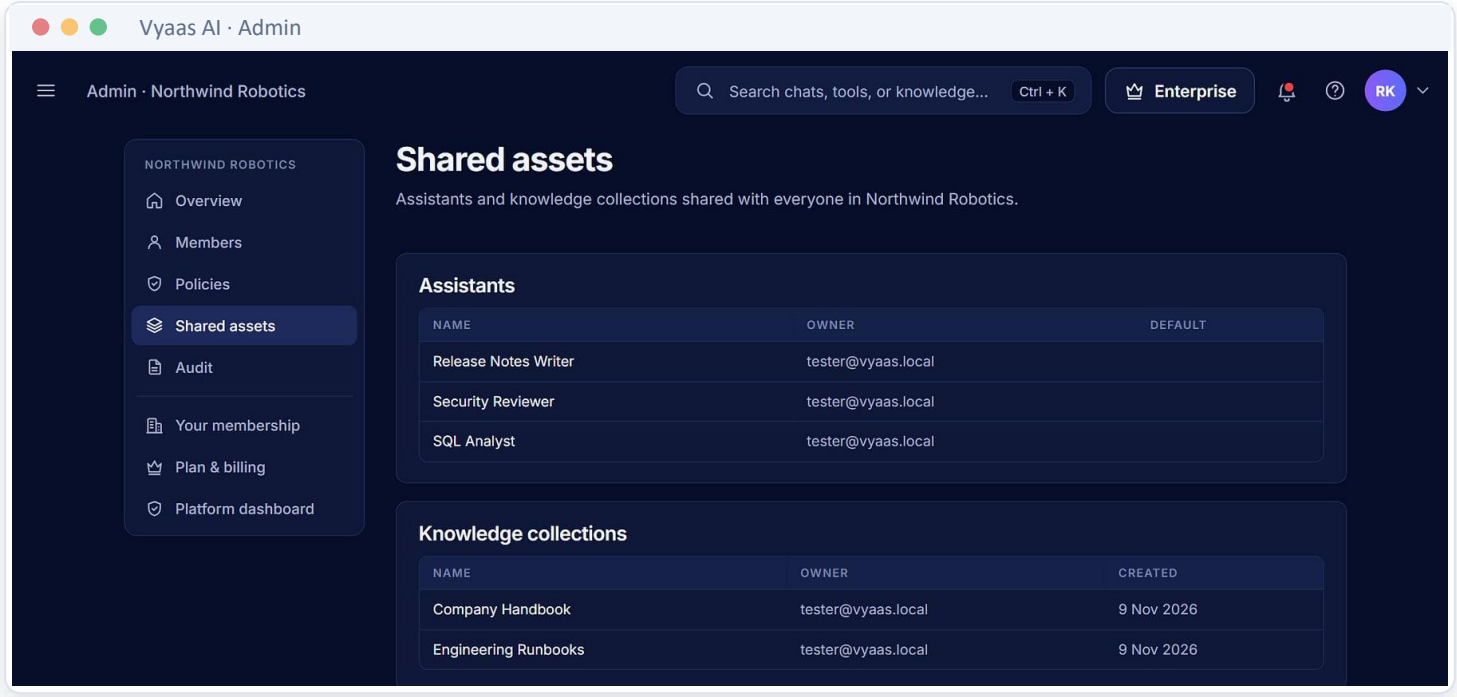

One approved way of working for everyone.

Shared knowledge

Collections the whole organisation can cite.

Productive on day one

New members inherit the team's best assets.

Shared assets: assistants and knowledge collections shared with the organisation (demo data).

TOKEN OPTIMISATION ENGINE

Spend fewer tokens on every request, without hurting answers

L1

Lossless normalisation

Whitespace and formatting cleaned when a message is stored; the meaning is untouched.

L2

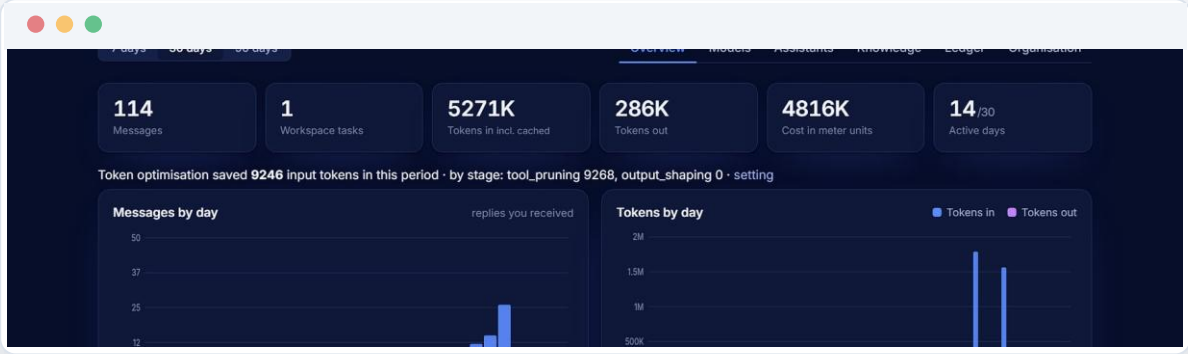

Context optimisation

Tool pruning, history compaction and attachment selection trim what is sent each turn.

L3

Guarded compression

Optional compression checked by a fidelity guard; anything risky falls back to the original.

Analytics: “Token optimisation saved 9,246 input tokens” in the period (demo data).

Savings on every reply

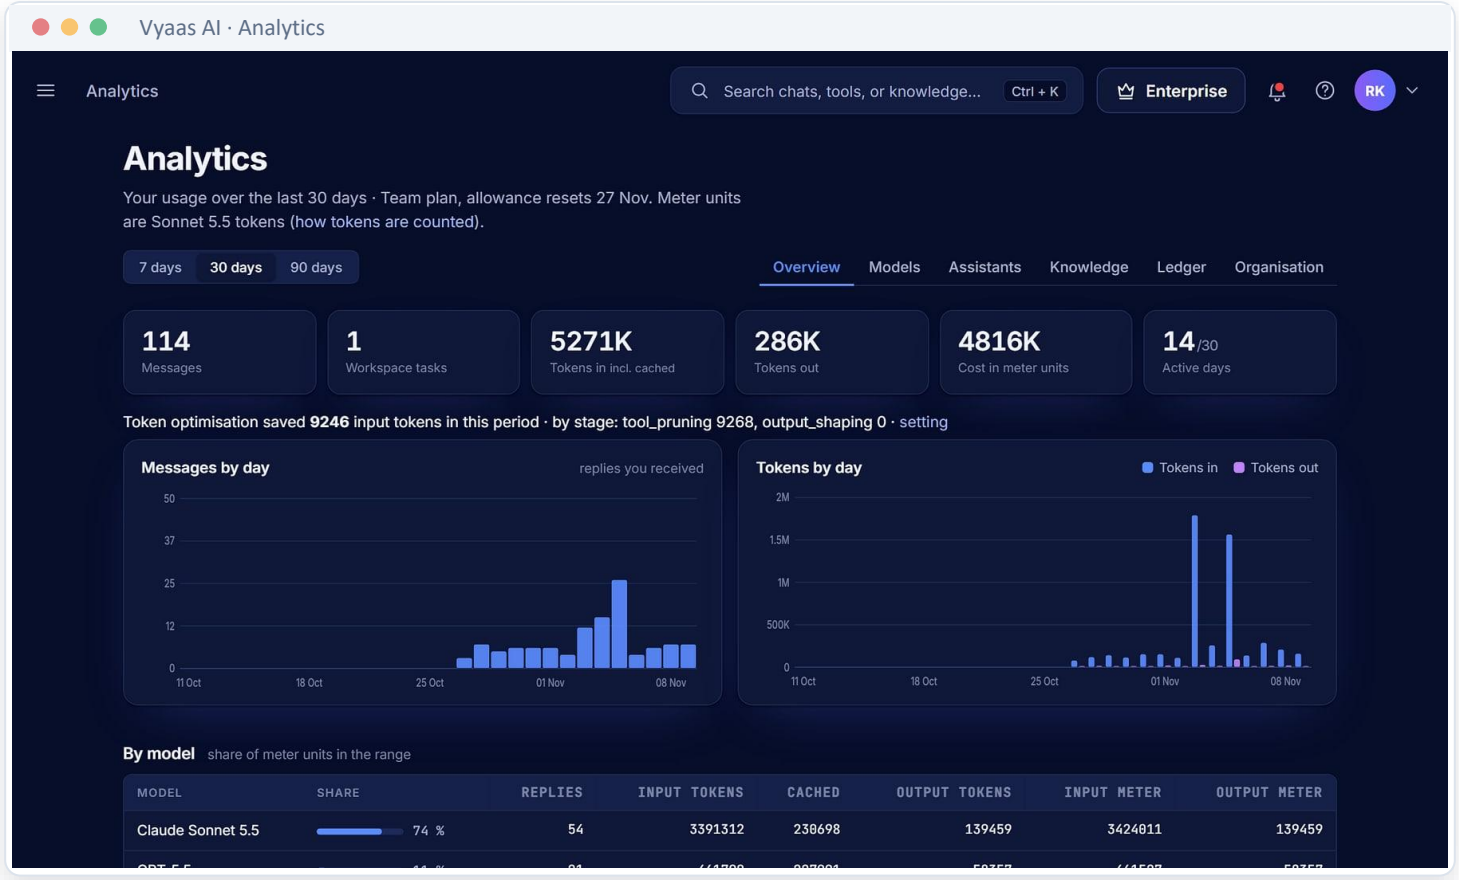

Each message reports what was trimmed and the tokens saved.

Your switch, or the org's

Members choose levels, or an organisation policy forces them.

USAGE ANALYTICS

See every token, by model, day and member

Analytics: messages, tokens, cost meters and usage by model (demo data).

Usage dashboard

Messages and tokens by day, model and assistant.

Cost in meter units

Measured the way models are priced.

Allowance

Plan allowance and roll-over at a glance.

Organisation view

Usage by member for owners and admins.

PLANS AND BILLING

Seven tiers, priced for the work, in INR or USD

FREE

₹0

$0 · a month

Try Vyaas: Sonnet and Haiku, 1 workspace.

PLUS

₹999

$12 · a month

All Claude models, web search, Git push.

PRO

₹2,499

$29 · a month

More usage, code execution, priority.

MAX

₹6,999

$79 · a month

Highest individual limits, 4 agent tasks.

TEAM

₹2,099

$25 · a month per seat

Per seat, minimum 3. Organisation features.

ENTERPRISE

₹1,25,000

$1,500 · a month

Org features, dedicated queue, named contact.

Prices exclude GST

18% added at checkout; annual billing gives two months free.

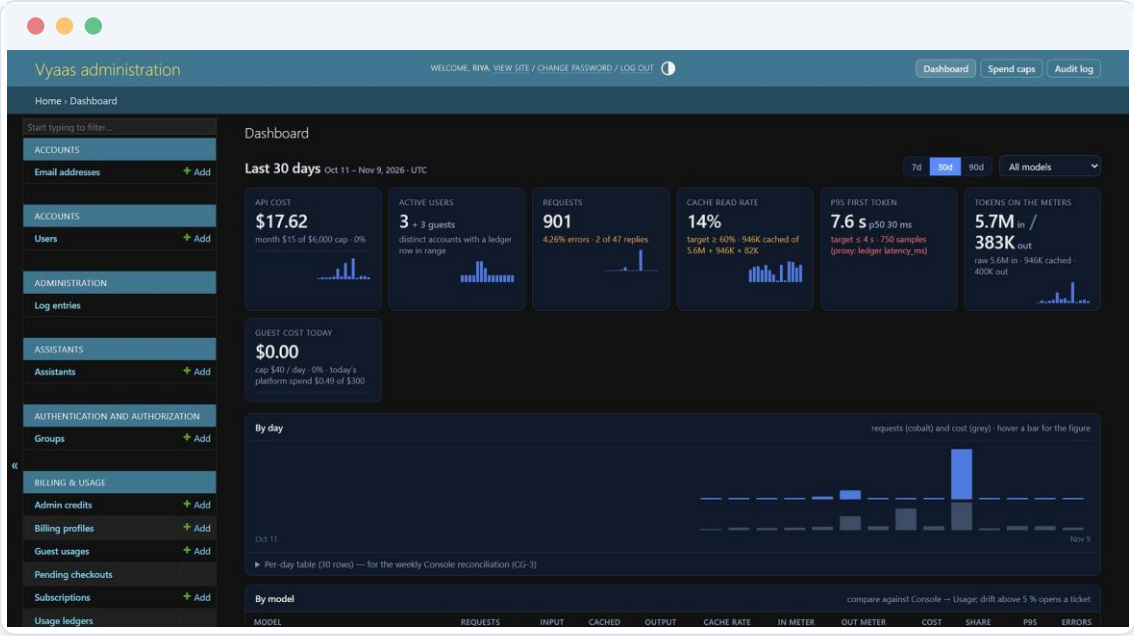

Metered in tokens

Sonnet-equivalent units; every reply shows what it used.

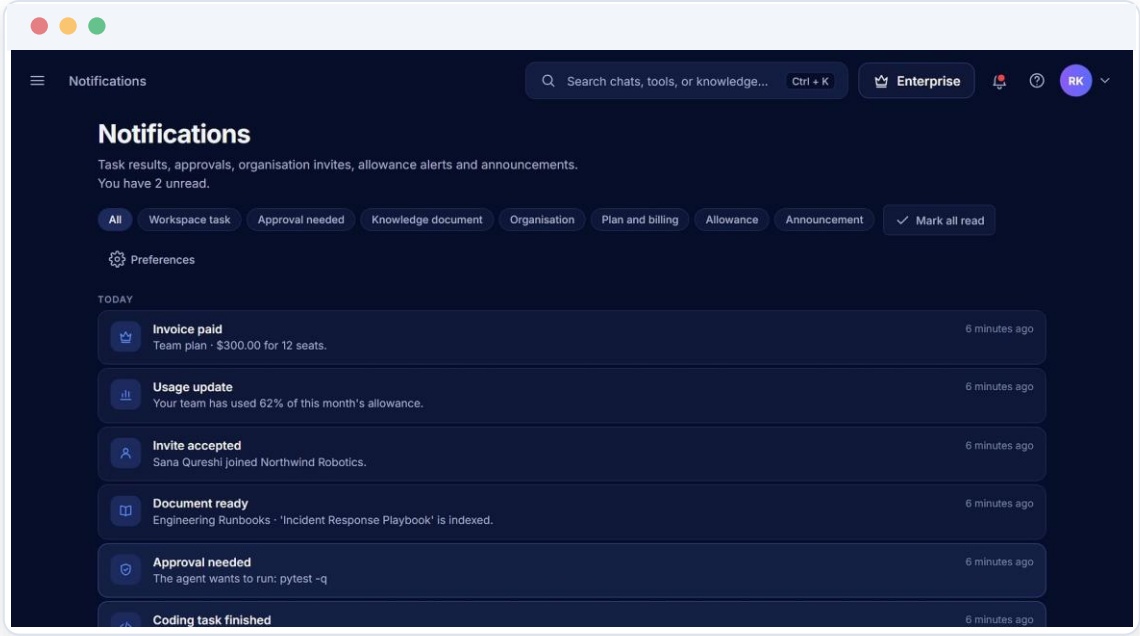

Razorpay or Stripe

Pay in INR or USD; a Guest trial needs no sign-up.

Operate the fleet, and keep everyone in the loop

Platform dashboard: cost, users, requests, cache rate and tokens by model (demo data).

Notifications: tasks done, approvals needed, documents ready, invites.

Per-user reports

Drill into any account's usage.

Grant credits

One-off allowances when needed.

Toggle access

Activate or suspend accounts.

Notifications

Tasks, approvals, invites, billing.

MULTI-MODEL CATALOGUE

Choose your horsepower: Claude and OpenAI

Provider-agnostic

Claude and OpenAI models in one catalogue; new models are added without code changes.

Per-plan gating

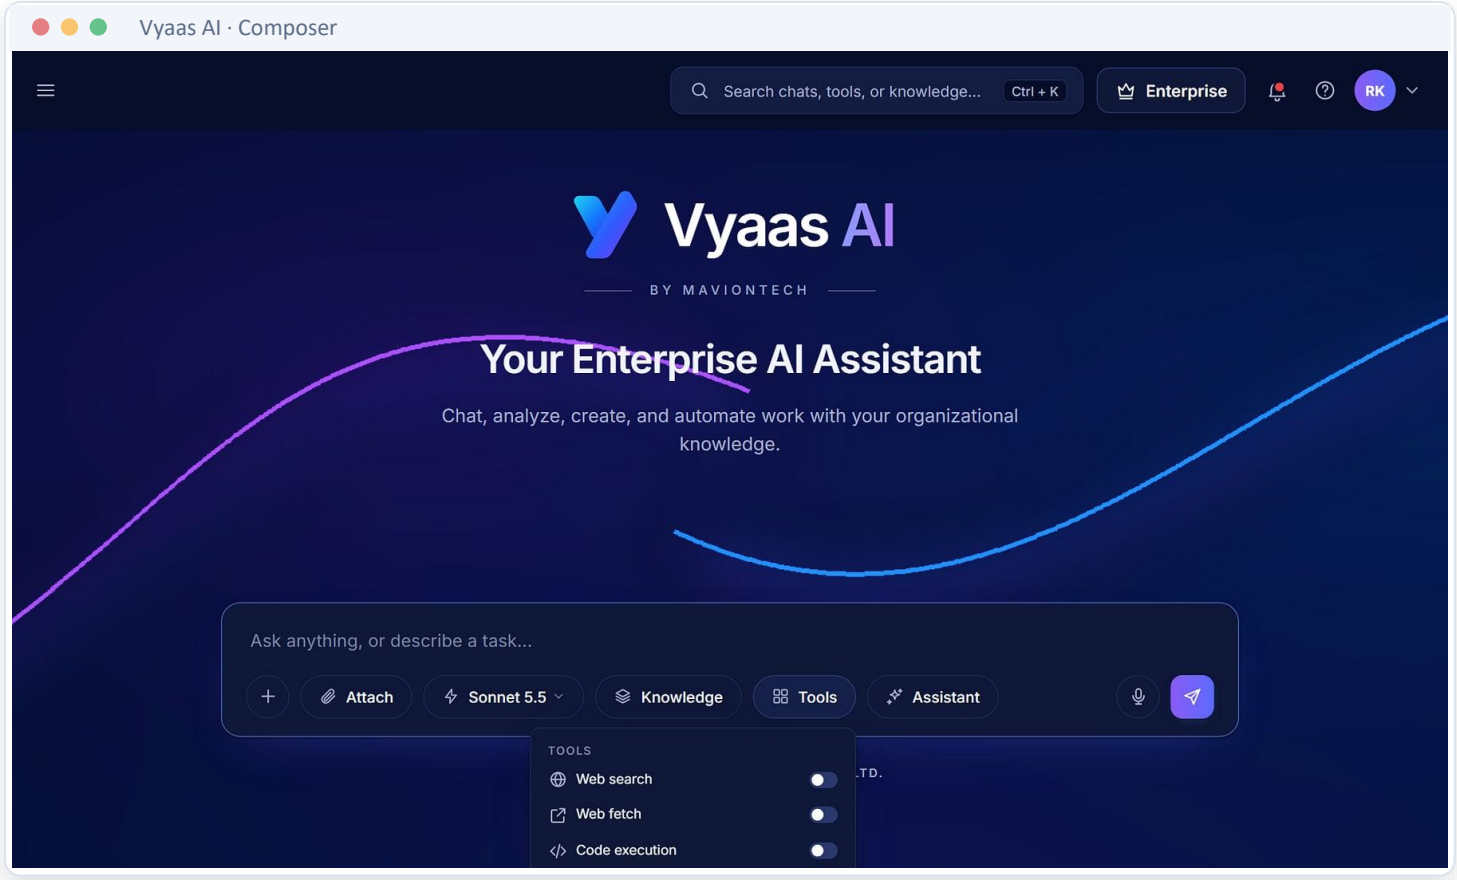

Each plan decides which models and how much effort.

Org allow-list

Admins narrow the models members may use.

One meter

Usage measured in Sonnet-equivalent units across providers.

Composer: model, knowledge, tools and assistant chosen per conversation (demo data).

ARCHITECTURE

Built for the enterprise from the ground up

Experience	Enterprise shell · chat · knowledge · documents · workspaces · admin console
Platform	Django 5.2 + DRF · allauth sign-in · organisations, policies and audit · Token Optimisation Engine
Intelligence	Provider-agnostic catalogue: Anthropic Claude + OpenAI · BM25 retrieval · document and image skills
Execution	Coding agent loop · gVisor sandbox · registry-only egress proxy · Connect companion
Foundation	MySQL 8 · Redis + Celery · gunicorn + whitenoise · encrypted secrets · Ubuntu VPS install scripts

Multi-tenant through organisations: data is scoped per organisation, with per-organisation policy and audit, in one application database.

SECURITY AND DATA HANDLING

Your data, your models, your controls

Encrypted secrets

Provider keys and Git tokens encrypted at rest; never sent to the model.

Sandboxed execution

gVisor containers, no network by default, approval gates.

Organisation scoping

Members see their organisation's shared assets, under its policies.

Audit trail

Administrative actions logged with actor and time.

Self-hostable

Install on your own Ubuntu VPS with the provided scripts.

Model choice

Allow only the providers and models your policy approves.

WHY SWITCH

Today versus with Vyaas AI

	TODAY	WITH VYAAS AI
Answers	Hallucinations, no sources	✓ Cited answers from your knowledge
Engineering	Autocomplete snippets	✓ An agent that opens pull requests
Governance	Data pasted into consumer tools	✓ Org policies, roles and audit
Models	Locked to one vendor	✓ Claude and OpenAI, your choice
Cost	Unpredictable token bills	✓ Optimisation and per-reply metering

Trust

Every grounded answer shows its source.

Throughput

Tasks go from request to PR.

Control

Policies narrow what members can do.

Spend

Fewer tokens per request, measured.

DEPLOYMENT AND INDICATIVE ROLLOUT

Live in weeks, not quarters

1

Stand up · week 1

Deploy on your VPS or use the hosted service; connect models; create the organisation.

2

Seed knowledge · week 2

Load collections, set policies and invite the team.

3

Pilot · week 3

Engineers use the coding agent; analysts use cited chat.

4

Scale · week 4+

Share assistants, review analytics, roll out organisation-wide.

Indicative only: timing depends on your environment, knowledge sources and team size, and is confirmed per engagement.

ROADMAP

What's next on the Vyaas AI roadmap

PLANNED

OAuth for Git providers

One-click connect; personal access tokens work today.

PLANNED

GitLab support

Beyond GitHub, with the same workflow.

PLANNED

Push and PR from Connect

Open pull requests from a workspace on your own machine.

PLANNED

Warm task containers

Dependencies that persist across task steps.

Planned items from docs/Vyaas_AI_Coding_Agent_P0_Spec (deferred items). Not in the current release; timelines to be confirmed.

MavionTech
Momentum with Vision

LET'S GET STARTED

Put a cite-first, ship-ready AI platform to work

Start with a pilot team on your data, under your policies, with the models you choose.

Book a demo
